MICROCHIP IDENTIFICATION

- Easy way to get back your stolen pet.
- Easy way for traveling around the world with your pet.
- Easy way to have the pet identification number at any time and place.

What is a microchip?

A microchip has the size of a grain of rice, about 12 mm and is a small injectable glass cylinder. Each microchip carries a unique number which can be read by a special scanner. The veterinary implants it beneath the pet's skin in the shoulder area, this procedure is painless and easy to do, comparing to a vaccination. It stays there for the animal's entire life and helps to identify the pet and owner. Every microchip is registered in a databank. Micro chipping is very useful in case of a lost pet and while international travelling, because many countries require now a microchip for pets to enter the country.
